Timor Black

Bambusa Lako

NON-INVASIVE 40-50 FEET TALL 4" DIAMETER CANES

One of the most outstanding ornamental species as a landscape specimen. A stunning plant from East Timor in the Indonesian Archipelago this species has shiny black canes with intermittent green stripes. absolutely gorgeous. This plant is so vertical it can be pruned out to resemble the form of the Japanese running bamboos - that is, when the older, smaller canes are removed from the clump, the look of an open grove can be achieved with periodic maintenance. Canes are 4" in diameter. This plant is quick to size and stature. The canes emerge green, turn rich koa brown that darken to black within several months.
